

NASA's Origins program is a decades-long study addressing the origins of the universe, various astronomical bodies, and life. The Origins program was started in the 1990s.

So far, it consists of the following missions:

ground-based

Keck telescopes*

Large Binocular Telescope Interferometer*

Keck Interferometer*

airborne

Stratospheric Observatory for Infrared Astronomy (SOFIA)*

space based

Hubble Space Telescope (HST)*

Far Ultraviolet Spectroscopic Explorer (FUSE) - completed

Spitzer Space Telescope (SST) - completed

Kepler Space Observatory - completed

Space Interferometry Mission (SIM) - cancelled

Terrestrial Planet Finder (TPF) - cancelled

James Webb Space Telescope (JWST) *

Single Aperture Far Infrared Observatory (SAFIR)

Large UV/Optical Telescope

Life Finder

Planet Imager

Missions marked with * are operational.
