

The AI Security Institute (AISI) is a research organisation under the Department for Science, Innovation and Technology of the United Kingdom that aims "to equip governments with a scientific understanding of the risks posed by advanced AI". It conducts research, and develops and tests mitigations.

The organisation was created as the AI Safety Institute and renamed in February 2025. Its creation followed the world's first major AI Safety Summit, which was held in Bletchley Park in 2023. The institute's stated goal is "building the world's leading understanding of advanced AI risks and solutions, to inform governments so they can keep the public safe". It is designed like a startup in the government, "combining the authority of government with the expertise and agility of the private sector".

AISI has made access agreements with Anthropic, Google and OpenAI to test their models before release. It has an open-source platform called Inspect that permits companies, governments and academics to run standardised safety tests for AI usage. Among its work is the reported detection of multiple serious vulnerabilities that could enable development of biological weapons; the vulnerabilities were fixed before the model was launched.

It conducts research on diverse fields of AI application. One study by AISI found that large language models (LLMs) post-trained for political persuasiveness became systematically less accurate and up to 51% more persuasive on political issues. AISI has also worked on the usage of AI for emotional needs. It found that nearly 10 percent of UK citizens used systems like chatbots for emotional purposes on a weekly basis. It found that "systems are now outperforming PhD-level researchers on scientific knowledge tests and helping non-experts succeed at lab work that would previously have been out of reach" in a report published in December 2025.

Former chief AI officer of GCHQ Adam Beaumont is the institution's interim director. Jade Leung is the chief technology officer, who in August 2025 was appointed as the prime minister's AI adviser.
