

Accessibility of telehealth services or F.780.2 is a technical standard developed by the World Health Organization and ITU (Study Group 16) that defines accessibility requirements for technical features to be used and implemented by governments, healthcare providers and manufacturers of telehealth platforms to facilitate the access and use of telehealth services by persons with disabilities.

Definition

World Health Organization (WHO) defines telehealth as the "delivery of health care services, where patients and providers are separated by distance.

Overview

Requirements 1 to 6 for persons with vision impairment and blindness

Requirements 7 to 11 for deaf and hard of hearing persons

Requirement 12 for persons with speech difficulties

Requirements 13 to 15 for persons with mobility impairments

Requirements 16 to 20 for persons with mental health conditions and psychosocial disabilities

Requirements 21 to 23 for persons with developmental and intellectual disabilities

Requirements 24 and 25 for persons with learning disabilities
