

Suno is a generative artificial intelligence music creation platform. It is designed to generate music that can include vocals and instrumentation. The platform was initially developed by Suno, Inc., of Cambridge, Massachusetts. Suno has been widely available since December 20, 2023, after the launch of a web application and a partnership with Microsoft, which included Suno as a plugin in Microsoft Copilot.

The program operates by producing songs based on text or audio prompts provided by its users.

The company has been sued by the Recording Industry Association of America for copyright infringement. A 2026 leak reported that the company had used stolen content from major platforms including YouTube Music, Genius, and Deezer for data training.

History

Suno, Inc., was founded by four people: Mikey Shulman, Georg Kucsko, Martin Camacho, and Keenan Freyberg. They all worked for Kensho, an AI startup, before starting their own company in Cambridge, Massachusetts.

In April 2023, Suno released their open-source text-to-speech and audio model called "Bark" on GitHub. On March 21, 2024, Suno released its V3 version for all users. The new version allowed users to create a limited number of four-minute songs using a free account. Users can pay for more features. In April 2024, a sentimental ballad was generated with Suno based on the text of the MIT License.

In June 2024, a lawsuit, led by the Recording Industry Association of America, was filed against Suno and Udio alleging widespread infringement of copyrighted sound recordings. The lawsuit sought to bar the companies from training on copyrighted music, as well as damages of up to \$150,000 per work from infringements that have already taken place. On July 1, 2024, a mobile app for Suno was released.

On November 19, 2024, Suno upgraded its AI song model program to v4.

In January 2025, Mikey Shulman remarked on a podcast, "I think the majority of people don't enjoy the majority of the time they spend making music."

In March 2025, one day after thousands of musicians including Thom Yorke and ABBA's Björn Ulvaeus signed a letter calling for Suno to stop training its model on copyrighted music, Timbaland endorsed Suno in a video on the company's website.

In July 2025, Suno user imoliver signed a record deal with Hallwood Media, which became the first instance of a traditional music label signing an AI-based creator. The AI-artist Xania Monet later signed with Hallwood for US\$3 million. Monet's songs were generated by Suno AI by poet Telisha Jones.

In November 2025, Suno agreed to a \$500 million dollar lawsuit settlement, in which Suno would be allowed to train its models on Warner Music Group's music catalog, and WMG would control aspects of AI likeness, music, audio, software, copyrights, AI tools and music created by users on Suno. As part of the settlement, Suno also acquired the concert discovery platform Songkick from WMG. In August 2026, Suno signed a music licensing deal with BMG Rights Management, while assuring that artists and songwriters would have their rights protected and be compensated for licensing their music.

Copyright

In 2024, Suno, Inc., was sued by the Recording Industry Association of America for copyright infringement, and thousands of musicians have signed a letter demanding that the company cease using copyrighted music in their training data. While Suno refused to disclose the dataset used to train its artificial intelligence, a leak was reported in 2026 suggesting stolen content from at least six major music platforms. Youtube scraping was done through proxies from the Israeli company Bright Data. The volume of stolen content is estimated to be at least 370,813 hours long, in addition to roughly 1 million hours of podcasts.
